3.2 FRAMEWORK CABINET TYPE

The Cabinet type enclosure parts are a combination of the AKA framebars and a sidepanel. It is made from Aluzinc of 1.5 mm thickness for the painted as well as for the unpainted design.

It is equipped with holes and slots like the open type system and can be used with the standard LØGSTRUP parts used in the open type framework.

The Cabinet panels are supplied in sizes from 1 to 12 modules in length and from 1 to 3 modules in depth.

The Cabinet system is mainly meant for smaller panels due to its limitation in strength and sizes.
